

REMARKS

The Applicant has received and reviewed the Official Action mailed by the Office on 27 May 2005 (hereinafter, the "Action"), and submits this paper as a fully-responsive reply thereto. The Applicant respectfully requests reconsideration and favorable action on the subject application at the earliest convenience of the Office.

As a preliminary matter, the Applicant expresses appreciation for the Office's consideration of the Applicant's comments regarding the eligibility of Brothers as a § 102(e) reference, as indicated in the Advisory Action mailed on 18 March 2005 and in the Action. However, the Applicant has reviewed the papers received in connection with both the Advisory Action and the Action, and is unable to locate the copy of the Brothers provisional filing mentioned in the Advisory Action and the Action. The Applicant's comments below do not focus particularly on Brothers. Therefore, the Applicant proceeds with this response assuming that the Brothers provisional filing includes the subject matter relied upon to support the rejections of the Applicant's claims as stated in the Action. However, the Applicant requests a copy of the Brothers provisional filing with the Office's next communication to the Applicant

The Applicant also notes that claims 33-36 and 71-75 have been previously cancelled. However, the Action stated rejections of claims 33-36.

1 Claims 1-7, 10-32, and 37-70 are pending, of which claims 14 and 20 have
2 been amended as indicated in the claim listing above.

3
4 **35 U.S.C. § 103 Claim Rejections**

5
6 As stated in Paragraph 7 of the Action, Claims 1-7, 12, 14-15, 18, 20-25,
7 28, 30-37, 40, 42-54, 57, 59-62, and 65-70 stand rejected under 35 U.S.C. § 103(a)
8 as being unpatentable over U.S. Patent No. 6,415,280 to Farber et al. (hereinafter,
9 “Farber”), in view of U.S. Patent Application Publication No. US 2002/0083178
10 A1 to Brothers (hereinafter, “Brothers”), and of U.S. Patent No. 5,359,659 to
11 Rosenthal (hereinafter, “Rosenthal”). The Applicant respectfully traverses these
12 rejections for the reasons set forth below.

13
14 Turning to **independent claim 1**, the Applicant reproduces claim 1 here for
15 convenience, with emphasis added for ease of discussion:

16
17 “1. (previously presented) A network system, comprising:
18 a first device to maintain an original resource;
19 a second device to maintain a replica resource remotely from the first device, the replica
20 resource being replicated from the original resource;
21 memory to store a cached descriptor corresponding to the original resource;
22 a security component to determine whether the replica resource will pose a security risk
23 to the second device upon receipt of a request for the replica resource, wherein the request
24 designates a resource locator, the security component:
25

1 being configured to determine whether the request will pose a security risk to the
2 second device;

3 formulating a descriptor corresponding to the replica resource and comparing the
4 formulated descriptor with the cached descriptor; and

5 if the formulated descriptor and the cached descriptor are not equivalent,
6 formulating a second descriptor corresponding to the original resource and comparing the
7 formulated descriptor with the second descriptor.”

8
9 Attention is directed to the portions underlined in claim 1 as reproduced
10 above. On page 8, the Office cited Farber, column 31, lines 31-33 against the
11 underlined portions of claim 1 above. For convenience, the Applicant reproduces
12 the relevant portion of the Action here:

Art Unit: 2131

can be verified and have their integrity check to ensure that they match the stored True Names and any change in a True Name potentially signals corruption in the system and can be further investigated (Farber: inter alia, Column 34 Line 45 – 55). (e) Farber further discloses if an error is found (i.e. the file is corrupted), the system "has the ability to heal itself by finding another source for the True File with the given name (Farber: inter alia, Column 31 Line 31 – 33: This must require formulating a second descriptor (i.e. second True Name // Descriptor) corresponding to the original resource (i.e. another source that holds the original true file) so that the validation of original uncorrupted file can be conducted). Therefore, Farber indeed teaches formulating a descriptor corresponding to the replica resource and comparing the formulated descriptor with the cached descriptor (i.e. True Name of Farber's), and then if the formulated descriptor and the cached descriptor are not equivalent, formulating a second descriptor corresponding to the original resource and comparing the formulated descriptor with the second descriptor" (i.e. (d) & (e) as addressed above).

1 For further convenience, column 31, lines 31-33 of Farber, as cited in the Action,
2 are reproduced here, with surrounding text:

3 location from a remote system or removable media.

7. Verify True File

4 This mechanism is used to verify that the data item in a
5 True File registry 126 is indeed the correct data item given
its True Name. Its purpose is to guard against device errors,
malicious changes, or other problems. 30

6 If an error is found, the system has the ability to "heal"
7 itself by finding another source for the True File with the
given name. It may also be desirable to verify that the error
has not propagated to other systems, and to log the problem
or indicate it to the computer operator. These details are not 35
described here.

8 To verify a data item that is not in a True File registry 126,
9 use the Calculate True Name primitive mechanism described
above.

10 The basic mechanism begins with a True Name, and 40
operates in the following steps:

- 11 (A) Find the True File registry entry record 140 corre-
sponding to the given True Name.
- 12 (B) If there is a True File ID for the True File registry 45
entry record 140 then use it. Otherwise, indicate that no
file exists to verify.
- 13 (C) Calculate the True Name of the data item given the file
14 ID of the data item.
- 15 (D) Confirm that the calculated True Name is equal to the 50
given True Name.
- 16 (E) If the True Names are not equal, there is an error in
17 the True File registry 126. Remove the True File ID
from the True File registry entry record 140 and place
18 it somewhere else. Indicate that the True File registry 55
entry record 140 contained an error.

BEST AVAILABLE COPY

1
2 While column 31, lines 31-33 of Farber may refer to a “healing” capability,
3 the Applicant submits that Farber provides scant detail on how this “healing” is
4 performed, aside from “finding another source for the True File with the given
5 name”. Farber is silent as to what this “healing” particularly entails. In light of
6 the limited description provided by Farber, the Applicant respectfully disagrees
7 with the assertion in the Action that Farber’s “healing” capability “must require
8 formulating a second descriptor ... corresponding to the original resource”
9 (emphasis added). Tellingly, the sentence from Farber mentioning the “healing”
10 capability does not reference the “True Name” identifier used throughout Farber’s
11 description. Instead, this sentence uses the term “given name”, and the antecedent
12 for this reference is not entirely clear. Nevertheless, had Farber intended to refer
13 to the True Name identifier in the context of “healing” its system, Farber should
14 have done so clearly.

15
16 The Applicant also notes that Farber describes a “basic mechanism” used in
17 a situation in which a calculated True Name of a data item does not match a given
18 True Name (Farber, column 31, lines 38-56). In this situation, Farber teaches
19 removing an entry from the True File registry entry record 140 and placing it
20 somewhere else (Farber, column 31, lines 53-55). The fact that Farber provides
21 this level of detail in column 31, lines 40-56 in describing an error handling
22 scenario, as compared to the scant treatment given the “healing” teaching in lines
23 31-33 in that same column, further weakens the Office’s interpretation of lines 31-
24 33, and the conclusions drawn therefrom by the Office. Furthermore, Farber’s
25

1 handling of a scenario in which identifiers associated with two data items do not
2 match, as described in column 31, lines 40-55 of Farber, neither teaches nor
3 suggests the features recited in the last paragraph of the Applicant's claim 1.

4
5 Summarizing the foregoing comments, the Applicant submits that Farber
6 fails to teach or suggest at least the features recited in the last paragraph of claim 1
7 for at least two reasons. First, column 31, lines 31-33 of Farber, as cited in the
8 Action, provides insufficient detail to support an interpretation covering the
9 features recited in the Applicant's claim 1. Any motivation or suggestion to read
10 Farber's limited teaching in lines 31-33 so broadly as to support a rejection of the
11 comes only from the Applicant's teachings, and amounts to impermissible
12 hindsight reconstruction or interpretation of the prior art based only on the
13 Applicant's disclosure and claims. Second, other portions of Farber that provide
14 additional detail on Farber's processing, such as column 31, lines 40-56, fail to
15 teach or suggest the features recited in at least the final paragraph of the
16 Applicant's claim 1.

17
18 For at least the foregoing reasons, the Applicant submits that Farber fails to
19 support a § 103 rejection of claim 1 because it does not teach or suggest at least
20 the features recited in the final paragraph of claim 1. The secondary references,
21 Brothers and Rosenthal, are cited against portions of claim 1 other than the final
22 paragraph of claim 1, and are thus not discussed in detail here. The Applicant thus
23 requests reconsideration and withdrawal of the § 103 rejections of claim 1.
24
25

1 These same comments apply equally to pending claims 2-7 and 10-13,
2 which depend from claim 1. Claims 2-7 and 12 stand rejected on the same
3 grounds as does claim 1, while claims 10-11 and 13 stand rejected on different
4 grounds under § 103, and are addressed in more detail below. In any event, the
5 Applicant requests reconsideration and withdrawal of the § 103 rejections of
6 dependent claims 2-7 and 10-13.

7
8 Turning to **independent claim 14**, the Applicant has revised claim 14 to
9 clarify further features of the network server. For convenience, the Applicant
10 reproduces claim 14, with the above revisions shown in redline:

11
12 **14. (currently amended)** A network server, comprising:

13 a server component to receive a request for a resource maintained on the network server
14 and, in response to the request, implement security policies to prevent unauthorized access to the
15 resource;

16 a memory to store a cached descriptor corresponding to the resource; and

17 a security component that is registerable with the server component during run-time to
18 determine whether the request will pose a security risk to the network server, the request posing
19 the security risk if the resource has been corrupted and if execution of the resource will
20 compromise the network server, the security component being configured to:

21 formulate a replica descriptor corresponding to a replica of the resource and

22 compare the replica descriptor with the cached descriptor; and
23
24
25

1 if the replica descriptor and the cached descriptor are not equivalent, formulate a
2 second descriptor corresponding to the resource and compare the replica descriptor with
3 the second descriptor.

4
5 The Applicant notes that the features now recited in claim 14 are similar to
6 features previously recited in claim 1, and submits that the revisions to claim 14
7 are fully supported under § 112, 1st paragraph, on at least that basis. Also, because
8 the revisions to claim 14 are similar to features previously recited in claim 1, the
9 Applicant submits that the above comments directed to Farber apply equally to
10 claim 14. On at least this basis, the Applicant requests reconsideration and
11 withdrawal of the § 103 rejection of claim 14.

12
13 These same comments apply equally to pending claims 15-19, which
14 depend from claim 14. Claims 15 and 18 stand rejected on the same grounds as
15 does claim 14, while claims 16-17 and 19 stand rejected on different grounds
16 under § 103, and are addressed in more detail below. In any event, the Applicant
17 requests reconsideration and withdrawal of the § 103 rejections of dependent
18 claims 15-19.

19
20 Turning to **independent claim 20**, the Applicant has revised claim 20 to
21 clarify further features of the network server system. The revisions to claim 20 are
22 similar to the revisions made to claim 1, and are believed fully supported under §
23 112, 1st paragraph, on at least that basis. Additionally, because the revisions to
24 claim 20 are similar to features previously recited in claim 1, the Applicant
25

1 submits that the above comments directed to Farber apply equally to claim 20. On
2 at least this basis, the Applicant requests reconsideration and withdrawal of the §
3 103 rejection of claim 20.

4
5 These same comments apply equally to pending claims 21-24, which
6 depend from claim 20 and stand rejected on the same grounds as does claim 20.
7 On at least this basis, the Applicant requests reconsideration and withdrawal of the
8 § 103 rejections of dependent claims 21-24.

9
10 Turning to **independent claim 25**, the Applicant reproduces claim 25 here
11 for convenience, with emphasis added to ease discussion:

12
13 “25. (previously presented) A network server, comprising:

14 an Internet server to receive a request for a resource maintained on the network server
15 and, in response to the request, implement security policies to prevent unauthorized access to the
16 resource;

17 a security component that is registerable with the Internet server during run-time, the
18 security component having:

19 a validation component to *determine whether the request will pose a security risk*
20 *to the network server by determining if a total number of characters defining all of the*
21 *arguments of the request exceeds a maximum number of characters; and*

22 an integrity verification component to determine whether the resource will pose a
23 security risk to the network server upon receipt of the request.”
24
25

1 Recall that claim 25 stands rejected under § 103 as being unpatentable over
2 Farber in view of Brothers and Rosenthal. Farber clearly does not teach or suggest
3 a security component that is configured to determine whether a request will pose a
4 security risk, as noted in the Action at the bottom of page 5 in stating the rejection
5 of claim 1. Therefore, the Action cited Rosenthal for this teaching in rejecting
6 claim 1, as indicated at the top of page 6 of the Action. However, claim 1 does not
7 include the feature from claim 25 emphasized above. The Applicant also submits
8 that Rosenthal does not provide the teaching missing from Farber that is necessary
9 to support a § 103 rejection of claim 25. More particularly, while Rosenthal
10 pertains to a method for securing software against corruption by computer viruses,
11 the cited portions of Rosenthal does not appear to teach or suggest determining
12 “whether the request will pose a security risk to the network server by determining
13 if a total number of characters defining all of the arguments of the request exceeds
14 a maximum number of characters”, as recited in claim 25. The cited portions of
15 Rosenthal appear to discuss detection of viruses and corruption, but do not
16 recognize or address the issue of checking the number of characters in arguments
17 of a request as a security precaution.

18
19 On at least this basis, the Applicant submits that Farber and Rosenthal, even
20 assuming only for the sake of these comments that they are properly combined
21 under § 103, fail in combination to teach or suggest at least the above features
22 emphasized above in claim 25. Therefore, Farber and Rosenthal fail to support a
23 § 103 rejection of claim 25, and the Applicant requests reconsideration and
24 withdrawal of the § 103 rejection of claim 25 on at least this basis.
25

1 Pending claims 26-32 depend from claim 25, so the above comments apply
2 equally to these dependent claims as well. Claims 28 and 30-32 stand rejected on
3 the same grounds as does claim 25, while claims 26-27 and 29 stand rejected on
4 other grounds discussed in more detail below. In any event, the Applicant
5 requests reconsideration and withdrawal of the § 103 rejections of dependent
6 claims 26-32.

7
8 Turning to **independent claim 37**, the Applicant reproduces claim 37 here
9 for convenience, with emphasis added to ease discussion:

10
11 “37. (previously presented) One or more computer readable media containing a
12 security application, comprising:

13 a validation component to *determine whether a request for a resource poses a security*
14 *risk by determining if a total number of characters defining all of the arguments of the request*
15 *exceeds a maximum number of characters; and*

16 an integrity verification component to determine whether the resource poses a security
17 risk.”

18
19 The feature emphasized above in claim 37 is similar to the feature
20 discussed in detail above in connection with the rejection of independent claim 25,
21 and the comments above directed to the rejection of claim 25 apply equally here.
22 In the interest of conciseness, these comments are not repeated for claim 37.
23 However, based on similar considerations, the Applicant submits that Farber and
24 Rosenthal, even assuming only for the sake of these comments that they are
25

1 properly combined under § 103, fail in combination to teach or suggest at least the
2 above features emphasized above in claim 37. Therefore, Farber and Rosenthal
3 fail to support a § 103 rejection of claim 37, and the Applicant requests
4 reconsideration and withdrawal of the § 103 rejection of claim 37 on at least this
5 basis.

6
7 These same comments apply equally to pending claims 38-44, which
8 depend from claim 37. Claims 40 and 42-44 stand rejected on the same grounds
9 as does claim 37, while claims 38-39 and 41 stand rejected on different grounds
10 under § 103, and are addressed in more detail below. In any event, the Applicant
11 requests reconsideration and withdrawal of the § 103 rejections of dependent
12 claims 38-44.

13
14 Turning to **independent claim 45**, the Applicant reproduces claim 45 here
15 for convenience, with emphasis added to ease discussion:

16
17 **“45. (previously presented)** A method, comprising:

18 receiving a request for a replica resource stored on a computing device, the request
19 designating a resource locator having a resource path identifying a location of the replica
20 resource;

21 formulating a descriptor corresponding to the replica resource;

22 comparing the formulated descriptor with a cached descriptor corresponding to an
23 original resource stored on a second computing device remotely located from the computing
24 device, the replica resource being replicated from the original resource;

1 determining that the replica resource does not pose a security risk if the formulated
2 descriptor and the cached descriptor are equivalent;

3 *if the formulated descriptor and the cached descriptor are not equivalent, formulating a*
4 *second descriptor corresponding to the original resource;*

5 *comparing the formulated descriptor with the second descriptor; and*

6 determining that the replica resource does not pose a security risk if the formulated
7 descriptor and the second descriptor are equivalent.”

8
9 The feature emphasized above in claim 45 is similar to the feature
10 discussed in detail above in connection with the rejection of independent claim 1,
11 and the comments above directed to the rejection of claim 1 apply equally here. In
12 the interest of conciseness, these comments are not repeated for claim 45.
13 However, based on similar considerations, the Applicant submits that Farber and
14 Brothers, even assuming only for the sake of these comments that they are
15 properly combined under § 103, fail in combination to teach or suggest at least the
16 above features emphasized above in claim 45. Therefore, Farber and Rosenthal
17 fail to support a § 103 rejection of claim 45, and the Applicant requests
18 reconsideration and withdrawal of the § 103 rejection of claim 45 on at least this
19 basis.

20
21 These same comments apply equally to pending claims 46-60, all of which
22 depend ultimately from claim 45. Claims 46-54, 57, and 59-60 stand rejected on
23 the same grounds as does claim 45, while claims 55-56 and 58 stand rejected on
24 different grounds under § 103, and are addressed in more detail below. In any
25

1 event, the Applicant requests reconsideration and withdrawal of the § 103
2 rejections of dependent claims 46-60.

3
4 Turning to **independent claim 61**, the Applicant reproduces claim 61 here
5 for convenience, with emphasis added to ease discussion:

6
7 **“61. (previously presented)** A method, comprising:
8 receiving a request for a resource;
9 implementing security policies to prevent unauthorized access to the resource;
10 determining whether the request will pose a security risk by *determining if a total number*
11 *of characters defining all of the arguments of the request exceeds a maximum number of*
12 *characters*; and
13 determining whether the resource will pose a security risk if allowing the request.”

14
15 The feature emphasized above in claim 61 is similar to the feature
16 discussed in detail above in connection with the rejection of independent claim 25,
17 and the comments above directed to the rejection of claim 25 apply equally here.
18 In the interest of conciseness, these comments are not repeated for claim 61.
19 However, based on similar considerations, the Applicant submits that Farber and
20 Rosenthal, even assuming only for the sake of these comments that they are
21 properly combined under § 103, fail in combination to teach or suggest at least the
22 above features emphasized above in claim 61. Therefore, Farber and Rosenthal
23 fail to support a § 103 rejection of claim 61, and the Applicant requests
24
25

1 reconsideration and withdrawal of the § 103 rejection of claim 61 on at least this
2 basis.

3
4 These same comments apply equally to pending claims 62-70, which
5 depend from claim 61. Claims 62 and 65-70 stand rejected on the same grounds
6 as does claim 61, while claims 63-64 stand rejected on different grounds under §
7 103, and are addressed in more detail below. In any event, the Applicant requests
8 reconsideration and withdrawal of the § 103 rejections of dependent claims 62-70.

9
10 As stated in Paragraph 8 on page 23 of the Action, claims 10-11, 13, 16-17,
11 19, 26-27, 29, 38-39, 41, 55-56, 58, and 63-64 stand rejected under § 103(a) as
12 being unpatentable over Farber, in view of Brothers, in view of Rosenthal, and in
13 view of United States Patent Application Publication No. US 2002/0103712 A1 to
14 Rollins, et al. (hereinafter, "Rollins").

15
16 Turning to **dependent claim 10**, this claim depends from claim 1, so all
17 comments directed above to claim 1 apply equally to claim 10. In addition to
18 these comments, however, the Applicant also comments specifically on the
19 rejection of claim 10, as follows.
20
21
22
23
24
25

1 For convenience, the Applicant reproduces claim 10 here, with emphasis
2 added to ease discussion:

3
4 **“10. (previously presented)** A network system as recited in claim 1, wherein the
5 request further designates the resource locator having a resource path, the resource path
6 identifying a location of the replica resource, and *wherein the security component determines that*
7 *the request is not a security risk if the resource path does not exceed a maximum number of*
8 *characters.”*

9
10 As noted above at the beginning of these Remarks, the Applicant has not
11 received a copy of the Brothers provisional application with either the Action or
12 the Advisory Action. Therefore, the Applicant proceeds with these comments
13 based on what is contained in the Action, and reserves further comment on
14 Brothers until the provisional is received.

15
16 Turning to the Action, the Applicant agrees with the assessment on page 24
17 of the Action that Brothers does not disclose expressly that the security component
18 determines that the request is not a security risk if the resource path does not
19 exceed a maximum number of characters. Therefore, the Action cited Paragraph
20 [0087] of Rollins for this teaching.

21
22 Turning to Rollins in more detail, Rollins pertains to a method for securing
23 software against corruption by software viruses. Paragraph [0087] of Rollins
24 introduces a discussion of Address Identifiers. Paragraph [0088] of Rollins
25

1 indicates that the maximum length for a URL is typically two hundred fifty six
2 (256) characters, and also indicates that if the length of a given URL exceeds a
3 specified threshold, then IOM 308 uses an address identifier to reduce the overall
4 size of a modified URL. However, this teaching from Rollins fails to provide
5 what is missing from Brothers to support a § 103 rejection of claim 10.

6
7 Rollins teaches reducing the length of URLs under some circumstances, but
8 fails to teach or suggest any particular reasons for doing so. Rollins also fails to
9 teach or suggest any problems that are overcome by reducing the length of URLs.
10 More specifically, Rollins fails to teach or suggest that a given request “is not a
11 security risk if the resource path does not exceed a maximum number of
12 character”, as recited in claim 10. Like Brothers, Rollins does not appear to
13 recognize the security risks associated with resource paths having excessive
14 length, which is the issue dealt with in claim 10. Even if Brothers and Rollins
15 were combined, the resulting system would appear to simply truncate URLs that
16 were over 256 characters in length, but the resulting system would still not assess
17 the security risks associated with such URL lengths. Any motivation to do so
18 comes only from the Applicant’s teaching and claims, and not from the cited art.

19
20 Based on at least the foregoing, the Applicant submits that Farber, Brothers,
21 Rosenthal, and Rollins, even assuming only for the sake of these comments that
22 these references are properly combined under § 103, fail in combination to teach
23 or suggest at least the above features emphasized above in claim 10. Therefore,
24 Brothers and Rollins, in particular, fail to support a § 103 rejection of claim 10,
25

1 and the Applicant requests reconsideration and withdrawal of the § 103 rejection
2 of claim 10 on at least this basis.

3
4 Turning to claims 11, 13, 16-17, 19, 26-27, 29, 38-39, 41, 55-56, 58, and
5 63-64, each of these claims are dependent claims, so all comments directed above
6 to their corresponding independent claims apply equally to these dependent
7 claims. To the extent that the rejections of these dependent claims are based on
8 Brothers, the Applicant reserves further substantive comment until a copy of the
9 Brothers provisional is received.

10
11 **Conclusion**

12
13 The Applicant respectfully requests reconsideration and withdrawal of the
14 rejections of pending claims 1-7, 10-32, and 37-70. If any issues remain that
15 preclude issuance of this application, the Examiner is urged to contact the
16 undersigned attorney before issuing a subsequent Action.

17
18 Respectfully Submitted,
